## **Introduction**

This document describes my efforts for the third development sprint.

## **My Tasks**

My job was to add functionality to the animation display. Before, we could only add and delete from the end of the list and the focus was always on the last frame. I was tasked with making the whole list selectable, addable, and deleteable. To do this, I had to learn about events and event handling. The actual code to handle this new functionality was relatively small, but many bugs arose between the backend `std::vector` that held the animation and the graphical display of the animation. The current status of this feature is: functional, not fully tested.

## **Other Issues**

When I was committing my code, it decided to delete most of the code that Homajam added for this sprint. Before Thursday, I will add back this code manually.
