Subject Summary of personal sprint 3 work

Introduction

During this sprint I attempted to build on the outer grid from the previous sprint.

Summary

In this sprint I added to the outer grid function. In the previous sprint I had some problems and am still working on them. I tried creating the outer rectangle but couldn't figure out how to do it from `drawrect()` as it is hard to figure out how big it should be from screen to screen. Instead I took a different approach and made each individual pushbutton have an edge if it was on the border. The first error from this happened when the user would click on one of the edges. It would reset the border. To fix this, I made the border be drawn each time the color would change. Don't know if this is the best solution but it works. The second that I am still trying to fix is when a new frame is added. The border for some reason isn't drawn. Once when I figure this out, I can begin work on the outer grid.

Appendics

Here is an attached picture of what I have done. As you can see, the border is drawn in the first frame but isn't in the next. If the user selects an outer grid piece, it redraws the border.
